Sows on commercial farms and in extensive breeding carriers are calling for a large number of breeding and infectious diseases. Breeding diseases of bacterial, viral or parasitic etiology are present in a large number of farms in different percentages. The aim of this paper was to retrospectively descriptively examine the transmissible pathology of sows in an intensive and extensive manner of breeding. The results of bacteriological and coprological examination of rectal swabs and piglets from commercial farms were processed. The bearer of a number of breeding diseases is the sow as a caller who transmits the piglets to the cause of the disease since the presence of *E. coli*, *Cl.perfringens type C*, *Ascarissuum*, *Balatidium coli*, *Cryposporidium parvum* is established. Veterinarians should prepared control and preventive measures which have to be implemented in order to control the health status of the farm on the axis of existing pathology of the farm.

**Key words:** sows, transmissive pathology, piglets, farm
