Methodius"
Skopje, North Macedonia

Autologous fat grafting has become one of the most popular aesthetic procedures among plastic/dermatologists with a high satisfaction rate and patient compliance. It is intended for volume restoration in face and body, resulting in rejuvenation, revitalization as well as skin quality improvement. Taking fat from parts where it is in excess and filling the parts where it is missing, results in better body sculpture and improved body image: the procedure what is called liposculpture. Additionally to pure fat cells, part of the improvements are due to injected stem cells present in the adipose tissue.

We present our results of fat grafting done in more than 100 patients in the last 10 years. It was implemented in various aesthetic indications: facial voluminisation, breast and buttock augmentations, body sculpturing etc, both in men and women. We will discuss the technique, the refinements of the method as well as the utilization of the purified fat.

The success rate and satisfaction is high, but we will address the potential risks, complications and their prevention and treatment.

Lipofilling is powerfull tool in hands of experienced surgeon with increasing demand and amazing results when properly used.

Key words: lipofilling, fat grafting, aesthetic
